

Growfinix Data Analytics Internship

Final Submission Package

Project Development • Learning Progress • Final Presentation • Additional Work • Blog

Priyanshu Raj

Data Analytics / Data Science Track

Internship Objective

Turn raw data into cleaned, analysed and decision-ready outputs.

Build practical analytics projects with Python, SQL and visualization tools.

Document the full learning journey and progress clearly.

Create a final presentation that explains implementation and results.

Add extra technical work to strengthen the portfolio.

Publish a blog explaining the end-to-end analytics lifecycle.

Growfinix Data Analytics Internship

Portal Structure Followed

Task 1: Project

Task 2: Progress

Task 3: Presentation

Task 4: Additional Work

Task 5: Blog

Technology Stack

Growfinix Data Analytics Internship

Tools used across the internship projects.

Data Analysis

Python, Pandas

Visualization

Matplotlib, Seaborn, Plotly

Dashboard

Streamlit

Extraction

Requests, BeautifulSoup

Database

SQL, SQLite

Statistics

SciPy, Statsmodels

Complete Analytics Workflow

Growfinix Data Analytics Internship

The portfolio connects five skills into one practical process.

Data is collected from CSV files, HTML listings and SQL databases.
Raw records are cleaned, validated and transformed before analysis.
Visualizations and dashboards convert analysis into business communication.
Statistical tests protect decisions from false conclusions.

Project 1: Real Estate EDA

Growfinix Data Analytics Internship

Cleaning messy property data and finding pricing patterns.

Handled missing values, duplicate rows and inconsistent records.

Used IQR logic to flag outliers.

Created price per square foot for better comparison.

Analysed price distribution by neighbourhood and property size.

Project 2: Automated Data Extraction

Converting listing HTML into a structured CSV dataset.

Structured CSV Output from Web Scraping

title	location	price	area_sqft	price_per_sqft
2 BHK City Apartment	Indiranagar	7500000.0	1050.0	7142.857142857143
Family Villa	Whitefield	18900000.0	2850.0	6632.298771929877
Compact Studio	Hsr Layout	4200000.0	620.0	6774.193548387097
Premium 3 BHK	Koramangala	12750000.0	1720.0	7412.790697674419

Used BeautifulSoup selectors to parse property title, location, price and size. Converted unstructured listing text into clean Pandas columns. Exported structured CSV output for downstream analytics. Kept scraping logic conservative and did not bypass site restrictions.

Project 3: Tour Enquiry Dashboard

Growfinix Data Analytics Internship

Interactive business dashboard for enquiry and booking analysis.

Dashboard KPIs: enquiries, bookings, conversion rate and median budget.
Interactive filters help analyse destinations, sources and lead statuses.
Business use: plan sales capacity around peak enquiry hours.

Project 4: SQL Database Integration

Extracting analytical datasets from a relational database.

SQL Extraction: JOIN + Aggregation + Window Function

```
WITH destination_performance AS (  
  SELECT p.destination,  
         COUNT(b.booking_id) AS total_bookings,  
         SUM(b.booking_amount) AS revenue,  
         DENSE_RANK() OVER (ORDER BY SUM(b.booking_amount) DESC) AS revenue_rank  
  FROM bookings b  
  JOIN properties p ON b.property_id = p.property_id  
  GROUP BY p.destination  
  
  SELECT * FROM destination_performance  
  WHERE revenue_rank <= 5;
```

Used JOINS to connect users, properties and bookings.

Applied GROUP BY, HAVING, CTEs and window functions.

Loaded SQL outputs directly into Pandas DataFrames.

Generated booking and destination-performance datasets.

Project 5: A/B Testing Analysis

Using statistics to avoid unreliable business decisions.

Compared standard table layout against mobile-responsive card layout.

Calculated conversion rates, lift, p-value and confidence interval.

Result: Variant B was numerically higher, but not statistically significant at $\alpha = 0.05$.

Decision: do not ship only because one percentage looks higher.

Challenges and Solutions

Important implementation problems solved during the internship.

Messy data

Used Pandas checks for nulls, duplicates, invalid types and outliers.

Unstructured web data

Parsed HTML with selectors and cleaned extracted fields before export.

Dashboard usability

Built filters, KPIs and business-focused charts rather than static plots.

Multi-table data

Used SQL joins, CTEs and Pandas integration.

Experiment decisions

Used statistical significance instead of simple percentage comparison.

Key Learning Outcomes

What the internship portfolio demonstrates.

Practical understanding of the full data analytics lifecycle.

Ability to clean, transform and analyse imperfect datasets.

Ability to build interactive dashboards for business users.

Ability to use SQL and Python together for analytics workflows.

Ability to interpret statistical results before recommending decisions.

Final Portfolio Proof

Code

Final Submission Map

Growfinix Data Analytics Internship

How the repository maps to the Growfinix portal.

Task 1	Project Development & Documentation	Tour Enquiry Dashboard
Task 2	Learning Documentation & Progress Tracking	Weekly progress + skills docs
Task 3	Final Presentation & Summary	PPTX/PDF + summary
Task 4	Additional Project Work	EDA + SQL projects
Task 5	Research Paper or Blog	Analytics journey blog

Repository name suggestion: Growfinix-Data-Analytics-Internship
